

Pointing togalacb.com at the new website

For whoever manages the Squarespace account that holds `toGalacb.com`

This is a **DNS change only**. The domain stays registered with Squarespace, under the same account, with the same owner. Nothing is transferred and nothing changes hands. Two records are updated so the domain serves the new website instead of the Wix one.

It takes about **five minutes**, and is reversible in the same five minutes.

What changes — exactly two things

#	Type	Host	Current value	Change to
1	A	@	<code>185.230.63.107</code> (and .171, .186)	<code>75.2.60.5</code>
2	CNAME	www	<code>cdn1.wixdns.net</code>	<code>famous-madeleine-ce8004.netlify.app</code>

There are currently **three** A records on @ — `185.230.63.107` , `185.230.63.171` and `185.230.63.186` . All three are Wix. **Delete all three** and add the single new one.

What must NOT change

These records are the company's Microsoft 365 email. Deleting or editing any of them stops email arriving. They have nothing to do with the website.

Type	Host	Value	What it does
MX	@	togalacb-com.mail.protection.outlook.com	Delivers all company email
TXT	@	v=spf1 include:spf.protection.outlook.com -all	Stops our mail being marked as spam
CNAME	autodiscover	autodiscover.outlook.com	Lets Outlook set itself up on new devices
A	webmail	192.185.21.142	Webmail access
TXT	@	linkedin-site-verification=49f4291e...	Verifies our LinkedIn page
CNAME	_dmarc	_dmarc.wixemails.com	Email authentication
CNAME	s1._domainkey	s1._domainkey.togalacb.com.s019.ascendbywix.com	Email signing
CNAME	s2._domainkey	s2._domainkey.togalacb.com.s019.ascendbywix.com	Email signing

Rule of thumb: if a record is not one of the two in the first table, leave it alone.

Steps in Squarespace

1. Sign in at `account.squarespace.com`
2. **Domains** → **togalacb.com** → **DNS / DNS Settings**
3. Find the **A records** for host @ pointing at `185.230.63.x` — delete all three
4. Add one A record: host @, value `75.2.60.5`
5. Find the **CNAME** for host `www` pointing at `cdn1.wixdns.net`, and change its value to `famous-madeleine-ce8004.netlify.app`
6. Save

Do not change nameservers. Do not unlock or transfer the domain. Neither is needed. If Squarespace asks you to unlock anything, you are in the wrong screen.

What to expect

- Most visitors see the new site within **15–60 minutes**; some internet providers can take up to 24 hours.
- During that window some people see the old site and some the new. Both work — this is normal DNS propagation, not a fault.
- **Email is unaffected throughout**, because none of the mail records are touched.
- The website's security certificate is issued automatically within minutes of the change. No action needed.

If anything looks wrong — rollback

Put the original values back and everything returns to exactly how it is today:

- A record, host `@` → `185.230.63.107` , `185.230.63.171` , `185.230.63.186`
- CNAME, host `www` → `cdn1.wixdns.net`

The same propagation delay applies in reverse.

One thing worth doing separately

Please consider adding a second person to the Squarespace account with access to domain settings. At the moment one person is the only route to changing DNS for both the website and company email. If that account ever becomes unreachable, so does the domain.

Values confirmed from the Netlify dashboard on 29 July 2026. Netlify's preferred setup uses an ALIAS/ANAME record, which Squarespace's DNS does not support — the A record above is Netlify's documented fallback and is the correct option here.
